AB The alteration and clin. significance of brain natriuretic peptide (BNP) and cardiac troponin I (cTnI) in patients with congestive heart failure and ischemic heart disease were investigated. Forty-two patients were divided into group I (29, cTnI<0.15 ng/mL) and group II (13, cTnI>0.15 ng/mL). Left ventricular end-diastolic dimension (LVDD), left ventricular ejection fraction (LVEF), BNP and cTnI were measured before and 2, 4 wk after treatment. LVEF was significantly lower and heart function classification (HFC), LVDD, BNP and cTnI were significantly higher in group II than those in group I before treatment. Two weeks after treatment, HFC, LVEF, LVDD and BNP were significantly improved in group I (P<0.05). Four weeks after treatment, HFC, LVEF, LVDD, BNP and cTnI were significantly improved in group II (P<0.05), but LVDD and cTnI were still significantly higher in group II than those in group I (P<0.05). BNP had a high relation with LVDD in group I (r=0.871) and a middle relation in group II (r=0.619). CTnI had a pos. relation with LVDD in group II (r=0.629). Comprehensive evaluation of BNP and cTnI can be used not only to understand the heart function and left ventricular remodeling but also to predict the effect of treatment in patients with congestive heart failure, and thus provide a guidance for further therapy.
